Scenario	Category	Justification	Real-World Example
1. Login bug fix	**Corrective**	Fixing a coding error to restore normal functionality.	WhatsApp releasing a patch for a login session crash after an update.
2. OS upgrade support	**Adaptive**	Modifying the app to work on a new operating system version.	Updating Microsoft Office to maintain full compatibility with macOS Sonoma.
3. New feature addition	**Perfective**	Adding a new feature based on user requests to improve the app.	Twitter introducing Dark Mode for easier night viewing.
4. Performance optimization	**Preventive**	Refactoring code proactively to handle future high traffic.	Optimizing YouTube's video streaming algorithms ahead of a major global event.
5. Regulatory compliance	**Adaptive**	Modifying software to comply with external legal requirement changes.	Adding cookie consent banners and data privacy toggles to meet GDPR rules.
6. Feature removal	**Perfective**	Removing outdated, unused features to simplify maintenance.	Dropping support for old Internet Explorer plugins in modern web browsers.
7. Code cleanup	**Preventive**	Reorganizing and documenting code to prevent future errors.	Cleaning up legacy backend code to make future updates easier.
8. Third-party API change	**Adaptive**	Updating integration code because an external service updated its API.	A weather app updating its system when OpenWeatherMap changes its API endpoints.
9. User interface tweak	**Perfective**	Rearranging buttons and labels to improve layout and usability.	Redesigning an e-commerce checkout page layout based on user feedback.
10. Planned capacity increase	**Preventive**	Sharding databases in advance to prevent slowdowns before user growth.	Expanding Amazon server capacity ahead of Black Friday shopping traffic.
